

# Executive assessment

Girls' Connect was a portrait-oriented anime idle/gacha RPG launched globally in September 2022. Its public identity links EskyfunUSA, Forever Entertainment Limited, and Forever Entertainment Network Limited. The Android product ID was com.girlsconnect.an and the iOS App Store ID was 1628786023. The original Android release exceeded one million installs and roughly 160,000 ratings before Google Play removal in March 2025.

Its design combined a 70+ heroine collection, five elemental factions, front/back formation strategy, automated and simultaneous battles, offline progression, level synchronization, full hero-reset refunds, intimacy/gifting, PvE modes, arena/PvP, guild systems, rarity progression, VIP monetization, premium vouchers, and repeated live-service events.

The last clearly documented original Android client is version 1.0.205 from September 2023. The update celebrated the first anniversary, introduced Red Phoenix Fairy Xiyao, and added a new city scene. Archived iOS metadata ends at version 1.9 in October 2023. Both major storefront archives place disappearance around 5 March 2025.

The strongest post-shutdown finding is a continuing content lineage. Destiny Oracle, Idle Fantasia, Goddess Quest, and Grand Crown: Pandora's Fate expose overlapping systems, characters, presentation, or direct user-recognized continuity. Grand Crown remains active in 2026 and is the most useful live comparison target. Public evidence proves content continuity far more strongly than it proves the legal licensing chain.

**Bottom line: Girls' Connect is best understood as one commercial incarnation in a broader reusable content/game lineage, rather than an isolated one-off title. The root IP/licensing chain remains unresolved in public records.**

| iOS final archived client     | 1.9, 18 October 2023                                                            | Confirmed  |
| Google Play removal           | 4-5 March 2025 depending archive timestamp                                      | Confirmed  |
| iOS last seen                 | 5 March 2025                                                                    | Confirmed  |
| Original server shutdown date | No official date located                                                        | Unresolved |

GameFAQs records a 13 September 2022 US release for both Android and iOS. App-store archives contain a later November 2022 metadata date on iOS. This looks like storefront/catalog timing rather than proof of a second distinct launch.

APKPure and APKFab preserve the anniversary 1.0.205 changelog: Xiyao and a new city scene. AppBrain reports the app removed from Google Play on 5 March 2025. Chrome-Stats records 4 March 2025, a one-day indexing difference. AppsHunter records iOS last seen on 5 March 2025.

## 2. Publisher and corporate footprint

The public publisher labels changed by platform and archive. Android sources identify EskyfunUSA or Forever Entertainment Limited. iOS identifies Forever Entertainment Network Limited. The official idleplays.com service pages use Eskyfun branding and the support address eskyfun.cs@gmail.com.

| Entity / label                        | Public evidence                                                                 | Assessment                         |
|---------------------------------------|---------------------------------------------------------------------------------|------------------------------------|
| EskyfunUSA                            | Android developer label in GameFAQs/APK archives                                | Product-facing publishing identity |
| Forever Entertainment Limited         | Android publisher/developer label in AppBrain, APKCombo and classification data | Product-facing corporate label     |
| Forever Entertainment Network Limited | iOS developer and Sensor Tower publisher label                                  | Confirmed Hong Kong company        |
| HK company no. 2770571                | Hong Kong Companies Registry, incorporated 27 Nov 2018                          | Primary registry evidence          |
| idleplays.com / Eskyfun               | Official service terms/privacy/contact infrastructure                           | Shared platform infrastructure     |

The Hong Kong Companies Registry lists Forever Entertainment Network Limited, Chinese name Hengyou Network Technology Limited, company number 2770571, incorporated 27 November 2018. This is the strongest corporate-primary record located. Public evidence does not establish the complete beneficial-ownership or IP-rights chain behind every related title.

### 3. Product design and gameplay systems

#### Core loop

- Acquire heroines through gacha and events.
- Build a five-unit combat lineup with front/back positioning.
- Advance campaign/PvE while collecting idle/offline rewards.
- Raise combat power through levels, rarity/duplicates, gear/resources and related progression systems.
- Use Arena/PvP, Trial/challenge content and Guild/social systems as recurring engagement layers.
- Participate in rotating events, server activities and monetized progression.

#### Low-friction progression

The official store description explicitly promoted level synchronization: train only five heroines and other girls share their levels. It also promoted a hero-reset function returning 100% of invested resources. These two systems sharply reduce the experimentation penalty common in hero collectors.

#### Combat

The official description confirms five attributes: Fire, Water, Wind, Light and Dark, with restraining relationships. It names Burn, Poison, Revive, Freeze, Shock, Curse and Rage Drain as combat mechanics. It also confirms front/back row positioning, one-tap lineup control, hands-free combat, high-CP PvE stages, and simultaneous battles across multiple battlegrounds.

#### Relationship layer

Store copy confirms gifts and intimacy progression with heroines. The relationship layer served as a parallel collection/attachment loop alongside combat progression.

#### World and presentation

The player is the Commander of a mercenary force exploring the Land of Eileen after ancient divine wars, the fall of the gods, and the rise of dark forces. Marketing emphasized 2D anime heroines, animated scenes, and Japanese voice talent.

### 4. Heroes, factions, roles and meta

Official marketing advertised more than 70 heroines. Community and guide archives preserve a broad roster. Names repeatedly documented include Aurora, Sigurdley, Nidhogg, Tsubasa, Nicole, Niord, Frost Star, Labis, Gulvig/Gulfig, Mira, Utega, Cottonwood, Epsilon, Puro, Setsu, Nia, Dante, Cadley, Specter, Rin, Leviathan, Hera, Yuna, Lorelei, Misty, Petrolla, Sherra, Daisy, Bradley, Silassia, Mirenne, Alice, Donley, Vel, Ensei, Snow Ruler, Chloe, Bahamut, Rengetsu, Bonaire, Tenjin, Ruby, Black Crow, Michelle, Sasha, Pan, Liffa, Shikioni, Ketty, Syllas, Avera, Elvie, Granine, Alphen, Nepheru, Kurasha, Vladimira and Imperial Witch. Later material adds units or variants such as Dirge Leia-Mia, Siyi and Xiyao.

Guide archives identify role/class concepts including Warrior, Mage, Assassin and Support. Examples: Sigurdley as a Light Warrior, Aurora as Light Support, Dante as Dark Assassin and Utega as a Mage. Rarity material identifies R, SR, SSR and UR, with UR at the top of the original commonly documented hierarchy.

The meta changed over time. Early lists strongly favored units such as Sigurdley, Aurora, Nidhogg, Tsubasa, Nicole, Niord, Frost Star, Labis, Mira and Utega. Later lists elevated newer units and variants such as Dirge Leia-Mia, Specter and Setsu. This is consistent with live-service power creep and roster expansion.

## 5. Economy and monetization

The original app was free-to-play with in-app purchases and no store-listed advertising in the archived Android listing. Monetization centered on premium currency, summons, packs, VIP progression and voucher/top-up infrastructure.

- VIP status was visible in the product UI and community account trading referenced high VIP levels.
- Third-party top-up material documents voucher denominations from 100 through 10,000 and describes vouchers as usable for in-game packs.
- Historical reseller material lists a 10,000-voucher / approximately US\$100 tier, consistent with standard gacha high-ticket packs.
- Rarity and duplicate acquisition created a long-term collection/upgrade sink.
- Server events and later server merges provided recurring retention and spending moments.

A February 2023 YouTube record explicitly documents a server-merging event, showing consolidation pressure within roughly six months of launch. This is a useful live-operations signal, but it does not by itself reveal population or profitability thresholds.

## 6. Commercial performance and reception

### Scale

AppBrain records more than 1 million Android downloads and approximately 160,000 ratings. Chrome-Stats captured 1,038,449 downloads and 162,443 ratings near delisting. AppsHunter preserves roughly 8,000 iOS ratings.

### Launch economics

Sensor Tower reported US weekly revenue rising from about \$30,000 in mid-November 2022 to about \$129,000 by the end of December 2022. Downloads peaked around 24,000 in late November and active users reached about 32,000 by quarter end. These are weekly US estimates, not lifetime global revenue.

### Recurring praise

- Anime character art and Japanese voice acting.
- Fast early progression and generous onboarding.
- Idle convenience and simultaneous battle progression.
- Easy team experimentation because of level sync and full reset refunds.
- Large heroine roster and collection appeal.

### Recurring criticism

- Pay-to-win/VIP pressure and competitive spending advantage.

- Content stagnation after the 2023 update cadence ended.
- Account/progress loss complaints and inaccessible/full servers.
- Repetition and menu/system overload typical of feature-dense idle RPGs.
- Community allegations of reused assets from earlier related games. These remain allegations unless supported by rights documentation.

## 7. Technical and APK forensics

| Artifact                       | Finding                                                          |
|--------------------------------|------------------------------------------------------------------|
| Latest Android version         | 1.0.205, version code 205                                        |
| APK size                       | Approximately 606.7 MB                                           |
| Minimum Android                | Android 5.0 / API 21                                             |
| Architectures                  | arm64-v8a, armeabi-v7a, x86_64                                   |
| APKPure signature              | 5be503491c3341ddc220e7722d6d3d4d2612cac3                         |
| APK SHA-1                      | e43f4e4abda61b57f18524e5d3492a178219c64f                         |
| Uptodown SHA-256               | 75d32f5448125dc49662dd2242c126d3962d95ae7449ecdc7372a116146efad6 |
| Uptodown certificate signature | 9b7bb4756eb1ea0c8bcb8642ee72fa97                                 |
| XAPK split examples            | assets_pack_id_en, config.arm64_v8a, language and DPI splits     |
| Permissions                    | Archive reports 20 permissions                                   |

The archived metadata is strong enough to establish package provenance and compare future samples. It is not enough to claim a full static reverse engineering. A defensible binary-level analysis still requires acquiring the exact 606.7 MB artifact matching the documented hash and then inspecting its manifest, native libraries, managed assemblies/IL2CPP metadata, asset bundles, certificates, embedded endpoints, SDKs and configuration files.

One third-party permission index flags CAMERA, RECORD\_AUDIO and READ\_EXTERNAL\_STORAGE among the declared permissions. Permission severity labels on such indexing sites are editorial, not Android security verdicts. The exact original manifest should be treated as the authoritative source once the hashed APK is obtained.

## 8. Privacy, permissions and terms

The official idleplays.com privacy policy is a broad Eskyfun platform policy dated 2020, predating Girls Connect. It states collection categories that include identity/contact information and potentially financial/accounting information, global use of personal information, cookies, and disclosure to authorized staff or service providers. Later clauses address Facebook, Google, email and guest login data and describe deletion requests with a target response within one month.

The terms reserve broad control over virtual items and service operation. They describe maintenance/termination rights, restrictions on plugins and non-human operation, and conditions for role deletion or record retention. The text is awkwardly translated and appears to be a generic platform contract rather than a title-specific modern policy.

**Risk interpretation: the surviving policy language is broader and older than what would be ideal for a modern global live-service title. This does not prove misuse of data. It does mean privacy/compliance due diligence should rely on current platform declarations and binary/network inspection rather than the legacy web policy alone.**

## 9. Shutdown and account-persistence evidence

Confirmed: the Android app left Google Play around 4-5 March 2025 and the iOS listing was last seen 5 March 2025.  
Confirmed: the original client had not received a documented substantive Android update since September 2023.

Strong inference: the original live service later became unavailable or substantially nonfunctional. Multiple user reports describe missing progress, inaccessible servers, or a closed Girls Connect server. A May 2026 Google Play Community post explicitly states the user's Girls Connect server had closed and asks how to move the account to Grand Crown. The answer does not validate the claimed migration, so the migration itself remains user testimony.

Unresolved: no official end-of-service announcement with an exact shutdown date was located in the accessible public evidence. Therefore this dossier does not assign a precise EOS date.

## 10. Content lineage and successor titles

The public record supports a family of related titles with overlapping assets, characters or game structure. The exact legal relationship between every branch is not public.

| Title                       | Public relationship signal                                                                                     | Status / date           |
|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------------------------|
| Tales of Erin               | Community repeatedly identifies shared/reused character assets; EOS discussion predates Girls Connect          | EOS Oct 2022            |
| Girls Connect               | Target title; global release 2022                                                                              | Delisted Mar 2025       |
| Idle Fantasia               | Vietnamese publication explicitly calls it Girls Connect / Waifu Squad                                         | 2023-era branch         |
| Destiny Oracle              | AppBrain review calls it same game as Goddess Era, Girls Connect and Idle Fantasia                             | Removed Aug 2024        |
| Goddess Quest               | Current reviews name Utega, Labis, Petrolla, Frost Star and directly compare it to Girls Connect / Grand Crown | Active evidence in 2026 |
| Grand Crown: Pandora's Fate | Players identify old game/content; live store uses closely related heroine ecosystem and idle systems          | Active 2026             |

Community accusations that Girls Connect "stole" Tales of Erin assets are not treated as established fact. A legal conclusion requires rights-holder and licensing evidence. The safer factual statement is that substantial recognizable content continuity exists across multiple releases.

## 11. Grand Crown: Pandora's Fate comparison

Grand Crown is the strongest current live comparator. Google Play identifies BURSTGAME NETWORK LIMITED (Hong Kong), package com.burstgame.alsp, launch in June 2025, 100K+ store downloads, in-app purchases and ads. Third-party tracking estimates roughly 290,000 downloads by September 2026. Google Play shows a 4.5-class rating with about 7.7K reviews.

Its marketing preserves the same broad commercial grammar: anime goddesses, idle progression, bonding, voice acting, automated combat and aggressive progression incentives. It adds Live2D positioning, spirits, free VIP6 onboarding, and later-stage rarity/power escalation. This looks like a modernized monetization/presentation wrapper around a closely related content family.

Google Play declares personal-info collection, no third-party sharing, no encryption, and a deletion-request mechanism. Those are developer declarations and should not be read as an independent security audit.

User reviews provide continuity signals. One Chinese-language Google Play reviewer asks whether it changed companies because the game is old. A Portuguese review explicitly calls Tales of Erin the original and names Girls Connect and Destiny Oracle as closed copies. An Apple review says the reviewer was happy to find the game after an earlier Connect title disappeared. These statements are useful lineage testimony, not legal proof.

## 12. Evidence conflicts and unresolved questions

| Question                                                               | Current position                                                                                              |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Who owns the root character/IP rights?                                 | Unresolved. Public publisher records do not establish the complete rights chain.                              |
| Was Girls Connect licensed from Tales of Erin/Sapphire Sphere lineage? | Unresolved. Content continuity is strong; licensing documentation was not found.                              |
| Exact Girls Connect server shutdown date?                              | Unresolved. Store delisting is confirmed for March 2025; server closure is supported by later user testimony. |
| Can original accounts migrate to Grand Crown?                          | Not proven. Users ask for migration, but no official transfer program was located.                            |
| Was the original client Unity/IL2CPP?                                  | Not established from the public metadata gathered here. Requires exact-APK inspection.                        |
| What backend endpoints and SDKs were embedded?                         | Unresolved until binary/static analysis of the exact APK.                                                     |
| Lifetime revenue?                                                      | Not established. Sensor Tower gives useful Q4 2022 US weekly estimates only.                                  |

## 13. Reconstruction and design implications

For a studio studying this product family, the most transferable design lessons are systemic rather than visual.

- Use a five-unit formation with clear front/back positional logic and readable faction counters.
- Reduce roster experimentation friction through level synchronization and full resource resets.
- Let idle rewards, auto combat and parallel activities compress routine playtime.
- Give heroes distinct status identities, such as poison, freeze, burn, revive and rage manipulation, instead of relying only on stat scaling.
- Pair combat collection with a relationship/intimacy loop to strengthen attachment to the roster.
- Treat server proliferation cautiously. Girls Connect had public server-merge activity within months of launch.
- Avoid relying on VIP pressure as the primary retention engine. Archived criticism repeatedly links competition to spending.
- Plan account persistence, server consolidation and end-of-service communication as first-class product requirements.
- For modern benchmarking, inspect Grand Crown and Goddess Quest alongside the historical Girls Connect client.

The commercially important pattern is repeated repackaging. The same recognizable content family appears capable of supporting multiple launches with altered publishers, names, economies and presentation layers. Any studio seeking to reuse specific art, characters, names, audio or code must independently clear rights. System-level design study is a separate matter from copying protected assets.

Current character names and lineage reviews.

**Google Play Grand Crown**

<https://play.google.com/store/apps/details?id=com.burstgame.alsp>

Current publisher, package, downloads, rating, data-safety declarations, description.

**App Store Grand Crown**

<https://apps.apple.com/us/app/grand-crown-pandoras-fate/id6743778620>

Current iOS listing and user continuity testimony.

**Apptopia Grand Crown**

<https://apptopia.com/google-play/app/com.burstgame.alsp/about>

June 2025 launch and version history.

**Google Play Community thread**

<https://support.google.com/googleplay/thread/436364983/>

May 2026 user statement that Girls Connect server closed and claimed move to Grand Crown. Testimony only.

## Method and limitations

This dossier triangulates official pages, government registry material, store archives, APK archives, market-intelligence reporting, current successor storefronts, community reviews and historical guides. Storefront metadata and government records receive greater evidentiary weight than community posts. Community claims are retained only when useful and are labeled accordingly.

No exact APK binary was downloaded and decompiled during this pass. Therefore the report does not claim engine identity, source-code structure, backend endpoints, embedded SDK inventory, encryption scheme, asset-bundle contents or server protocol details. Those require a hash-verified binary forensic phase.

Research cutoff: 4 October 2026. Live storefront metrics change over time.
